# Recursion

Recursion

count

$$\text{count}(\text{line}) =$$

$$\text{count}(\text{line} - 1) + 1$$
$$\text{count}(\text{line} - 2) + 1$$

$$\text{count}(\text{line} - (k - 1) + 1) \leftarrow 2$$

$$\text{count}(\text{line} - k + 1) \leftarrow 1$$
$$\text{return } 1;$$

"(overlapping)"

Characteristics:-

(1) Self similar

~~the~~ simpler to  
solve or smaller

$$\begin{aligned} & \text{count(line)} \\ &= \text{count(line-1)} + 1 \end{aligned}$$

↓  
Simpler problems

+ something in size.  
↳ more

(2) Base Case:- Nothing but  
a "Self Similar" problem  
that you can solve directly

Example of where we use recursion:

- (1) Looking for word in dictionary
- (2) Looking for files in dir
- (3) fractals

ILP → PL:- No Loops At all  
↳ only recursion

→ when / when you would you in run sim.

"Smart"  
 ahead  
 low is  
 demand  
 and smaller  
 pub fund

(1) You can decompose the problem into "simpler" smaller self-similar problems +  $\Delta$   
 (2) Look for "Base Case" ~~2nd~~

part work of work in this step

$\left[ \begin{array}{l} \square \\ \square \\ \square \\ \square \\ \square \end{array} \right]$

$\left[ \begin{array}{l} 1 + \text{const}(\text{line} - 1) \\ 2 + \text{const}(\text{line} - 2) \end{array} \right]$

True

3 rules for recursion

1. → Every input has a call Recursive Case  
Base Case
  2. → There <sup>"must"</sup> be a base case 2 should  
be reachable from every input.
  3. → The recursive case must make the problem  
simpler & progress towards the base case(s)
- 

recursiveFunc() {

if (test for simple / base case) {

compute the sol. ~~with~~ directly // No recursion

3 else {

1. Break the problem into smaller problems of same form
2. call recursiveFunc on each of smaller problems.

3. Reassemble the results of smaller problems.

int // using loops.  $n \geq 1$

```
int fact(int n) {
```

```
    int result = 1;
```

```
    for(int i = 1; i <= n; i++) {
```

```
        result = result * i;
```

```
    } return result;
```

```
// n >= 1
```

```
int fact(int n) {
```

```
    if(n == 1) {
```

```
        return 1;
```

```
    } else {
```

```
        return n * fact(n-1);
```

```
    }
```

→ Recursive Program  
No loops

$$1! = 1$$

$$2! = 2 \times 1$$

$$3! = 3 \times 2 \times 1$$

$$n! = n \times (n-1) \times (n-2) \times \dots \times 1$$

$$\Rightarrow n! = (n) \times (n-1)!$$
