

Last Class:-

→ Data structures

We started: Vectors/Collections

↳ Abstract Data Types
include <vector>

Vector<int> nums;
Vector<string> names;
Vector<char> c;
Vector<double> d;
Vector<Vector> v;

→ C++

STL:-

↳ standard
template
library

→ standard
library

↳ "vector.h"

Arrays (C++C)
↑

[Vector<int> nums; → // { }
Vector<int> nums = { 1, 2, -3, -23; }
↑ ↳ 0 → 1 → 2 → 3

SIP

→ Capital

Vector<int> nums = {42, 17, -6, 0, 28};

Vector<string> names; // {}

names.add("pritam"); // {"pritam"}

names.add("siya"); // {"pritam", "siya"}

~~names.add~~

names.insert(0, "lokesh"); // {"lokesh", "pritam", "siya"}

Vector

Vector<int>
names(5);

~~names~~

Arrays (vs Vectors) → "fixed size"

→ int names[5]; → // declaring an array

Array
names[5]

↳ very difficult to add/delete elements / resize

vector
 ↑
 vector<int>
 names(5)
 names[1]
 = 30;
 ↳ (Pren message
 (Pren 10)

Array

int names[5];

names[1] = 35; X → Expects

↳ Give unexpected
behavior

Vector member functions

| name | description |
|--|---|
| vector<type> name; vector<type> v; | → // initializes a vector of // type data type v // of size 0 |
| v.add(value); v += value; | → add value to v (at the end of v). |
| v += v1, v2, ..., vn; | // add v1, v2, ..., vn in order to v |

Methods

`u.clear()`

`u[i]` or `u.get(i)`

↓
~~int~~ `int a = 5;`
`a = u[i];`
 or `u[i] = a;`

`names[5] = "Gautami";`
~~// Error~~ ; ↑

| | |
|---------|----------|
| "Pooja" | "Pritam" |
| 0 | 1 |

Description

Remove all the elements

(In `u`. Becomes an empty vector)

get the value at index `i`

```
vector<string> names
= {"Pooja", "Sita"};
```

```
string str = names[1];
cout << str; // size
```

```
names[1] = "Pritam";
```

```
cout << str << names[1];
// size pritam
```

Method \rightarrow size 5

u.insert(i, value)

u.isEmpty()

u.size()

(u.size() == 0)

u.size() // 6

~~u~~ u.remove(i)

u.size() // 5

~~1~~ 1 0 1 - 1 6 7 8

Behavior Description

\rightarrow Inserts value at index i.

\rightarrow Boolean value \rightarrow true if vector has no elements false otherwise

returns # of elements in the vector

u.remove(2);

Member
 $v[i] = \text{value};$
 \Downarrow
 $v.\text{set}(i, \text{value});$

Description
Set element
at position i
to value

$v.\text{substr}(\text{start}, \text{length})$

→ make a new sub
vector starting at
position 'start' & of
length 'length'.

$v.\text{size}()$ → return
size of
 v

iter

$v.\text{remove}(\text{start}, \text{length})$ → write
a function
 ~~$\{ \text{for (int } i = \text{start}; i < \text{start} + \text{length}; i++)$~~
 $v.\text{remove}(i);$

1 2 3 4 5 6 7 8 9 10 11 12

string str = v.to_string()

returns a string
representation of v

"{ 2, 5, 6, -7, 8, 10, 11, 13 }

cout << v;
ostr → output stream
of a file

print the 'string' representation
of vector v

i=0; i < length; (++) {

start = 1
length = 3

~~for (int i = start; i < start + length; i++) {~~

~~v.remove(i); v.erase(start);~~

1
2 | 3 | 7 | 8 | -10

3

X

Homework

Write it using while loop

looping/iterating over all the values of vector

Vector names { "ab", "cd", "ef" };

```
for (int i = 0; i < names.size(); i++) {
```

```
    cout << names[i] << endl;
```

}

// ab
// cd
// ef

```
for (int i = names.size() - 1; i >= 0; i--) {
```

```
    cout << names[i] << endl;
```

}

fe | dc | ba

// ef
// cd

ef | cd | ab
fed | dc | ba

```
String str = names[0];  
cout << str
```

// ab
// cd
// ef

iterative

lab | cat | cgn

for (string name: names) {

cout << name << endl;

// for each name

1 / in names

}
Caution:
You can not
modify names
inside this
loop

lab

cat

cgn

~~U.insert(2, 42)~~

U: old
index: 0 1 2 3 4
value: 3 8 9 7 5

U.insert(2, 42);

U.remove(1);
U: new
index: 0 1 2 3 4 5
value: 3 8 9 7 5
index: 3 4 2 3 4 5
value: 3 8 9 7 5
P inserted

U.remove(1);

U: new
0 1 2 3 4
3 42 9 7 5

efficiency?

① Given a vector of strings -

{ "ab", "cd", "ef" }

→ write a function `reversePrint(vector<string> vec)`

which ~~prints~~ - returns a string

efcdab

② Given a vector of strings

{ "ab", "cd", "ef" }

write a function `reversePrint1(vector<string> vec)`

→ Return a string: fedcba

Write a function

\downarrow $\{5, 6, 7\}$
 $35, -56, 100$

int getMax (Vector<int> vec) {

// return the max value of vec

Do it
next class
